

AI Fullstack Intern – Technical Assignment

Objective

Build a simple, functional candidate application and hiring management system with two parts:

1. A **public job application page** where candidates can apply for available jobs.
2. An **admin dashboard** where an admin can manage jobs and applications through the hiring process.

The focus of this assignment is on **functionality, clean implementation, usability, and speed** rather than creating an overly complex or visually heavy interface.

1. **Open Link** where any candidate can apply for any job (From a dropdown – for now create 10 random jobs)
 - a. Apply with:
 - Name
 - Phone
 - Email
 - Resume Upload
 - Job (Selected From Dropdown)
 - A brief note
2. **Dashboard with an Admin Login** – Simple email and password (for now don't build signup, only focus on login)
 - a. Create a temporary login:
 - Email: `admin@enter.in`
 3. b. This user can manage (create, edit, add, delete) jobs.
 - c. This login user should be able to see all the candidates who applied for the job with all the details captured from the open link that the candidate submitted.
 - d. This user can filter the candidates according to the job.
 - e. An application can be moved along the following stages:
 - Applied (Initial)
 - Reject
 - R1 / R1 Reject
 - R2 / R2 Reject
 - R3 / R3 Reject
 - Approved
 4. f. The admin can also filter the candidature according to the above stages.
5. **Keep it simple and functional** – Not looking for a very fancy UI. Looking for fast and elegant solutions.
6. Please make sure the assignment is **hosted online** and share the **working links** for both the candidate application page and the admin dashboard along with your submission.
